Keywords: hydrology and water education, COVID-19, university education, Europe

Abstract

COVID-19 caused many disruptions, not only in society but also in university education, including in hydrology and water-related sciences. Taking part in an academic teaching training course at Uppsala University during COVID-19 we got curious about how COVID-19 might have impacted European water education. Consequently, we chose to investigate this aspect in the mandatory project of the course by conducting an online survey. In this paper, we communicate the results of the survey and reflect (hold up a mirror to water education) on how the teaching of hydrology and water-related sciences changed due to COVID-19. The answers of 28 respondents, working in the field of hydrology at different Universities across Europe, showed that in the pre-COVID-19 classroom lectures, laboratory and fieldwork were commonly used teaching formats in courses with 10 to more than 40 students. These results agreed with those found literature. The occurrence of COVID-19 forced hydrological education to suddenly move from classroom to online teaching, which was possible thanks to the available digital tools and technical infrastructure. The practiced online teaching format remained lectures. Most of the respondents (> 40%) reported not using classroom assessment techniques to gauge the students' performances. In addition, a loss of human interaction in the online environment was noticeable. Hence, whether students reached their learning outcomes during distance teaching was largely unknown. Most affected learning activities were the ones that could not be moved to online teaching such as laboratory and fieldwork. As a result, comprehensive hydrological knowledge might

26 be missing for at least several cohorts of hydrologists. In this way, COVID-19 caused a secondary effect

27 on society which needs skills to solve future challenges such as water management in a changing

28 climate. Next to negative, we observed positive COVID-19 aspects, e.g., the hydrology community

29 explored novel teaching formats, and shared teaching material and experiences online. COVID-19

30 forced hydrology teachers to explore, improvise and be creative to continue teaching. Hydrology can

31 use this experience to learn from and modernize hydrology education by developing a lesson design

32 suited for the online environment, including best practices and making practical and "exotic"

33 nontraditional teaching formats accessible for all hydrology and water students.

1.   Introduction

35 Hydrology and water-related sciences cover among others: water engineering, hydraulics, hydropower,

36 groundwater engineering, water supply and water treatment, hydrogeology, fluid mechanics, ecology,

37 biology, and social science. Hydrology and water-related sciences study the occurrence, circulation,

38 and distribution of water for sustainable use in a changing climate (Foley et al., 2011; Beven, 2016;

39 Blöschl et al., 2012; Seibert et al., 2013). To address these current and future water related challenges

40 university water education fundamental (Wagener et al., 2012).

41 The university education system we know today evolved over centuries and adjusted its pedagogical

42 approaches from focusing on a few elite scholars to the current massive market-driven integrated

43 learning with student mobility across Europe and the world (Forest et al., 2006). Water-related sciences

44 are generally considered applied sciences and are taught to a student audience with different educational

45 backgrounds (e.g., engineering, natural or social science) in different departments and institutions (e.g.,

46 engineering, biology, geology, environmental science, or geography) each with a variety of educational

47 foci (Gleeson et al., 2012; Seibert et al., 2013; Wagener et al., 2012). The special issue "Hydrology

48 education in a changing world" (Seibert et al., 2013) showcased in 28 papers the variety of hydrology

49 education and different pedagogical approaches up to the year 2012. The pedagogical approaches

50 ranged from teaching and learning activities using physical models in classrooms (Rodhe, 2012),

51 teaching hydrological modelling (Seibert and Vis, 2012a) and learning theoretical physical processes

52 complemented with experimental work in the laboratory and field (Gleeson et al., 2012; Lyon et al.,

2013). In addition, general aspects such as the implementation of interdisciplinary curricula (Blöschl et al., 2012), transboundary socioeconomic water issues (Douven et al., 2012) and different levels from education at the secondary school level (Reinfried et al., 2012) to post-graduate education and continued learning for practitioners (Kaspersma et al., 2012) should be addressed.

Contemporary water education has a high complexity, involves multidisciplinary topics (Wagener et al., 2012), and uses ~~high~~ specific terminology and definitions (Venhuizen et al., 2019). Hence, it requires a broad academic education as well as continuous professional development of ~~modern-day~~ engineers and water professionals with uneven backgrounds (Popescu et al., 2012; Wagener et al., 2012). Students require strong skills in basic subjects like math, physics, soil, ecology, and social sciences which should be taught in well-structured courses indicating the connections across disciplines (Wagener et al., 2012; Seibert et al., 2013). According to Seibert et al. (2013), the teaching methods should be "*rooted in the scientific and quantitative understanding of hydrologic processes, providing flexible hydrologic problem-solving skills that can evolve when new insights become available, and which can be adapted to provide solutions for new problems and to understand new phenomena*". Seibert et al. (2013) suggest that the educational system of hydrology must undergo a paradigm shift away from the current practice. The authors recognize that the current needs of hydrologists to account, e.g., global and local environmental change, do not necessarily match the training. In water education, new skill sets should be included to read, interpret, and learn from data and patterns in the landscape, conduct comparative studies to supplement learning through case studies, understand the spatiotemporal varying characteristics of hydrological systems, and the modeling of interacting processes such as human-nature interactions and feedbacks.

University education traditionally took place in classroom environments (French and Kennedy, 2017), and only more recently novel teaching methods are explored. Classroom Assessment Techniques (CAT) are useful tools (e.g., exit ticket, polls, quizzes, muddiest point, peer review using analog (e.g., piece of paper) or digital tools (e.g., clicker, Mentimeter, Kahoot)) to assess pre-knowledge, activate students, increase learning awareness, give student feedback and gauge student performance during or after a lecture (Goldstein, 2007). With the development of the internet and digital technology, education steps

80   away from campus teaching by exploring novel virtual learning environments (e.g, Garreta-Domingo

81   et al., 2018; Westera and Sloep, 2001). Examples of virtual learning environments are massive open

82   online courses on learning platforms (e.g., edX, www.edx.org; for courses overview use search and

83   keywords hydrology or water; Coursera, www.coursera.org, for courses overview use search and

84   keywords hydrology or water; or CUASHI, www.cuahsi.org/education/cuahsi-virtual-university) and

85   e-learning using e.g., virtual classrooms (Berry, 2019). While classroom lectures were optimized over

86   the centuries, as Berry (2019) described, it is necessary to develop different strategies for e-learning

87   that allow students to develop a structure, a sense of learning community, and social interactions in the

88   virtual environment (Berry, 2019; Lehman, 2006).

89   In addition to "traditional" classroom or novel virtual learning environments, hydrology students need

90   laboratory and field experiences to stimulate hypothesis testing and develop hydrological theories

91   (Blume et al., 2017; Kleinhans et al., 2010) and prepare students to cope with all challenges in their

92   professional life (John and Khan, 2018). In addition, the hydrology curriculum needs to cover, next to

93   wet hands-on experiences also programming skills (Kelleher et al., 2022; Merwade and Ruddell, 2012)

94   and tinkering with electronics to sense the environment (Hut et al., 2020; Kinar, 2021). Adding

95   electronics to the curricula, not only empowers but also facilitates student's hydrological learning and

96   process understanding (Kinar, 2021) and can act as a stepping stone for collecting scientific

97   spatiotemporal hydrometeorological data (Hut et al., 2010; Hund et al., 2016; Assendelft and van

98   Meerveld, 2019; Wickert et al., 2019; Karachalios et al., 2021). Despite their importance, field activities

99   are being more and more reduced due to a generalized trend of decreasing funds allocated to water

100   education and increasing the number of students. The cuts have "*reached crisis proportions in many*

101   *universities*" (Eagleson, 1988; Nash et al., 1990; Wagener et al., 2012) and are a worrying development

102   for hydrology education (Blume et al., 2017; Kleinhans et al., 2010; Vidon, 2015).

103   Since 2019, the COVID-19 pandemic impacted the entire world. Different European countries followed

104   different strategies in an attempt to minimize or prevent the spread of the virus (Alemanno, 2020;

105   ECDC, 2022). Common measures were social-distancing, and self-isolation while schools (Raffetti and

106   Di Baldassarre, 2022) and universities were closed (Schleicher, 2020). Suddenly universities were

107 forced to move from class to distance teaching (Stracke et al., 2022). Schaefli (2021) summarizes nicely

108 a hydrology teacher's perspective with all challenges involved due to this sudden shift to distance

109 teaching: "*timing was perfect: start of the semester, start of online teaching, video conference*

110 *infrastructure unavailable, three kids at home and me, a hydrology teacher who has never produced*

111 *any kind of video exceeding a 20s cell phone video*". Not only that little time was available to prepare

112 high-quality teaching material for distance teaching but also a lack of experience in distance teaching.

113 In addition, practical educational elements were canceled (e.g., field excursion, survey among Swedish

114 Universities (Fischer, 2020)) and COVID-19-related illness, motivational and emotional distress were

115 observed (Aristovnik et al., 2020; Bormann et al., 2021; Marzoli et al., 2021; Romeo et al., 2021) which

116 might have affected knowledge transfer in hydrology education negatively.

117 Taking part in an academic teaching training course at Uppsala University during COVID-19 we got

118 curious about how COVID-19 might impact European water education. We chose to investigate this in

119 the mandatory project of the course. With the special issue "Hydrology education in a changing world"

120 (Seibert et al., 2013) serving as a base for this study, we conducted an online survey (November 2020

121 to March 2021) focusing on 1) common teaching methods and classroom assessment and examination

122 techniques in pre-COVID-19 times and 2) how did these education methods and techniques change

123 during COVID-19. In the spirit of "*it takes a community to raise a hydrologist*" (Wagener et al., 2012)

124 during the pandemic and beyond, the aim of this paper is to communicate and potentially learn from

125 the results of our survey.

126 ## 2.   Methods

127 We based our survey on a survey by Fischer (2020) and extended it to investigate how COVID-19 might

128 impact European water education. The survey consisted of three sections 1) Information on the

129 respondent, 2) Water education in pre-COVID-19 and 3) Water education during COVID-19 (Table 1),

130 which consisted of in total of 30 questions (Table A1) and should have taken approximately 10 minutes

131 to answer. To reach as many people and obtain unbiased answers while respecting the privacy of the

132 participants the survey was set up as an anonymous web form using Google Forms (a web application

133 to create and share online forms and surveys, Google LLC). To have an unbiased result, a random

134   sampling method reaching a high number of participants from the total population of hydrology teachers

135   would be preferable (Gideon, 2012). However, to reach a large target audience, consisting of as many

136   hydrologists involved in university education across Europe (including student assistants, Ph.D.

137   students, lecturers/teachers, (assistant) professors, course administrators, and researchers) within a

138   certain time frame to represent the COVID-19 Zeitgeist we adopted an ad-hoc snowball sampling

139   approach. The link to the survey was sent by email to more than 200 contacts of the wider network of

140   the authors, all part of different Universities in water education across Europe (Berlin, Göttingen,

141   Stuttgart, Bucharest, Hamburg, University of Zürich and ETH Zürich, University of Freiburg iBr., Tu

142   Delft, VU Amsterdam, Wageningen, Florence and members of the EU-Cost "WATer isotopeS in the

143   critical zONe" consisting of more than 110 colleagues and further to 5 random people). In addition, in

144   the e-mail there was a request to spread the survey within the respective departments. The email with a

145   link to the form was sent in November 2020 with a reminder in March 2021. In addition, a post with

146   the link to the survey was posted on the Facebook Hydrol group. The authors of this group did not

147   participate in the survey.

148   The obtained answers were summarized and presented in different graphs using MATAB R2021a

149   (MathWorks). The number or percentage of respondents for a given question or answer was represented

150   as a bar or pie chart. More qualitative open questions with multiple responses were discussed in the text

151   or represented as word clouds. In a word cloud, the respondents' answers are summarized as text, with

152   the font size increasing and color-changing from grey to orange as the words become more frequent.

3.   Results and discussion

3.1 Snapshot overview of water education in Europe

Twenty-eight respondents working at Universities across Europe (Figure 1) in the field of hydrology,

geohydrology, chemistry, fluid dynamics, soil mechanics to environmental and civil engineering

(Figure 2a) answered the survey how COVID-19 might impact European water education. Because the

survey was set up to be as anonymous as possible with only the universities name and country (Figure

1b) being known. The 28 respondents consisted of researchers, lecturers, and different levels of

professors to course administrators (Figure 2b) who taught a wide variety of hydrology and water-

related courses from bachelor to Ph.D. ~~graduate school~~ level (Figure 3a & b). Unfortunately, only a few universities per country responded to the survey and some European countries were missing. The low response rate to our survey may be because the population of hydrology teachers was too-small, our e-mail with the survey link was flagged as spam or not forwarded within the respective departments. COVID-19 arouse the curiosity of many scientists and educators (including the authors) to study its effects on education in various scientific fields (Aristovnik et al., 2020; Eklund et al., 2022; Fischer, 2020; Bormann et al., 2021; Fox et al., 2021; Gonzalez et al., 2020; Haley et al., 2021; Keržič et al., 2021; Marzoli et al., 2021; Romeo et al., 2021; Salling Olesen et al., 2021; Wanigasooriya et al., 2021; Stracke et al., 2022). The many surveys conducted in relation to COVID-19 might have caused certain survey fatigue, as de Koning et al. (2021) which may also have been the case in our study. Given the few respondents a more detailed investigations should be carried. However, the results are of interest as they provide a first impression, similar to a snapshot sample campaign (a common and useful method to infer spatial process within a catchment e.g., Likens and Buso (2006); Temnerud et al. (2007); Fischer et al. (2015); Floriancic et al., (2019)), on the state of hydrology and water education across Europe as a result of COVID-19 pandemic.

3.2 Water education in pre-COVID-19 times

Our survey builds on this foundation and aligns with (Wagener et al., 2012) in terms of taught courses, course level, and the number of students per course (10 to more than 40 students, Figure 3). Furthermore, our study provides a more detailed overview of the most common teaching format used by the respondents in pre-COVID-19 times which were lectures (27 out of 28 respondents), followed by seminars (Figure 4a). Laboratory, experimental, and fieldwork were used by less than 50% of the participants as teaching formats. Peer teaching, role-play, group discussion, and video recording seemed the less common practiced teaching formats in water education and therefore can be considered more "exotic". Blume et al. (2017), Kleinhans et al. (2010), Vidon (2015) and Wagener et al. (2012) warned that more practical components are needed in the hydrological curriculum. Despite some novel teaching examples (AghaKouchak et al., 2013; Rodhe, 2012; Rusca et al., 2012; Seibert and Vis, 2012a, b; Lyon et al., 2013; Kinar, 2021) and exploring virtual learning environments (e.g., edX, Coursera and

188   CUASHI), a decade after these calls, it seems that traditional classroom lectures were the dominant

189   formats of teaching. Only 42% of the respondents indicated using CATS (specific software/tools for

190   questionnaires, survey style quizzes, or peer review techniques) to improve and gauge the students'

191   performance (Figure 4b). Closed book and oral exams or projects were commonly used examination

192   formats (Figure 4c). Hence, these results give the impression that hydrology and water education use

193   rather traditional teaching methods and are far from the needed paradigm shift proposed by Seibert et

194   al. (2013).

195   3.3 Water education during COVID-19

196   The beginning of 2020 came as a shock to hydrology research (CUAHSI Board of Directors &, 2022)

197   but especially for hydrology education when campus-based university education came to a halt.

198   Hydrological education was forced to suddenly move from classroom to online teaching which was

199   only possible because of the available digital tools and technical infrastructure (Figure 5). The practiced

200   teaching format remained lectures (Figure 4a). Instead, practical teaching methods, which are so

201   important for hydrology, were terminated. To some extent, an increase in the use of "exotic" teaching

202   formats such as prerecorded videos and group discussions could be noticed (Figure 4a).

203   Gonzalez et al. (2020) and Keržič et al. (2021) found that students were more focused during the

204   pandemic resulting in a positive study performance. By contrast, our hydrology respondents indicated

205   that students were less focused during the lecture (Figure 6d), student learning was impacted negatively

206   (reported by 67% of the respondents) and it was difficult to assess whether students reached their

207   learning goals (Figure 7e). These opposite observations could be explained by the use of CATs by

208   Gonzalez et al. (2020), compared to the majority of the respondents of this study indicated to not use or

209   were not familiar with CATs during pre-COVID-19 teaching (Figure 4b). Hence, it is likely CATs were

210   also not used during COVID-19 made it hard for teachers to give student feedback and gauge the student

211   performance in the online environment (Figure 6d-f). The examination changed from project work and

212   written exams (open- and closed-book) on campus (Figure 4c) to open-book take-home exams (Figure

213   4c and 6b). Respondents indicated an overall negative up to very negatively teaching experience due to

214   an extra effort to prepare for exams, trusting students to not cheat (which is hard to control) up to

215 lowering the level of exams, quality of education, and thus to (open feedback, Figure 7c and g, Figure

216 8). In addition, from open feedback we derived different challenges to face in the hydrology education

217 during COVID-19:

218 - Acquiring computer literacy – learning to deal with different platforms, solving various

219 computer problems (e.g., installing software and driver conflicts when attaching new devices)

220 - Required personal gadgets e.g., laptops, tablets with pens, video cameras, microphones and

221 headsets, and lights Adjusting the online courses to students with visual or hearing problems

222 - Data privacy and cyber security for students and staff

223 - Change from student-focused to teacher-focused surface learning

224 - Rethinking the organization of the learning process and designing a new time plan – when

225 moving the classes online, teachers need additional training, extra budget, new devices, stable

226 internet connections, and get accustomed to new digital tools and the virtual learning

227 environment.

228 The survey focused mainly on the year 2020 where some respondents indicated to perceive a difference

229 between the spring and autumn semester (Figure 7h). The perceived differences are likely because

230 different European countries imposed different infection control measures during the ongoing pandemic

231 (ECDC, 2022; Alemanno, 2020) where instead of COVID-19 distance teaching again pre-COVID-19

232 teaching styles were possible (campus teaching including laboratory and fieldwork). After the

233 finalization of the survey, additional hybrid formats appeared (e.g., students attending lectures in class

234 and online). Such hybrid formats require other skills compared to on-campus or distance teaching only

235 and require further research.

236 The challenges and negative hydrology teaching experience during 2020 could be due to the sudden

237 change from classroom to online teaching. Respondents indicated universities provided technical

238 support and training for distance teaching (Figure 5a). However, it is likely that due to the sudden

239 change the support focused on technical rather than lesson design in an online environment. Generally,

240 when teaching a course it is recommended to follow an integrated course design (Fink, 2013) which

241 was described for hydrology classroom teaching by Wagener et al. (2012) as the pre-COVID-19

242 developed Modular Curriculum for Hydrologic Advancement (MOCHA) ABCD lesson design concept

243 consisting of planning, delivering, and evaluating to improving for next time. As described by Ellis et

244 al. (2009) and Berry (2019), teaching in the online environment needs to consider the online digital

245 context in the lecture design, workload, interactivity, and engage students through personal and

246 professional interaction. Despite this framework, some exposure to virtual education and how to

247 optimize the student e-learning experience (Berry, 2019; Ellis et al., 2009; Lehman, 2006), the change

248 to online teaching somewhat improvised and a new experience for most of the teaching staff and

249 students. In addition, the teaching material, tailored for classroom teaching, needed to be rapidly

250 adjusted for online distance teaching. When teaching a class for the first time, the preparation can range

251 between 3 to 5 hours for a one-hour class, while subsequent years require only 1 to 2 hours (Wagener

252 et al., 2007). Similarly, teaching during COVID-19 required extra time for planning, delivering, and

253 wrapping up teaching activities (Figure 6). The extra time was comparable with the teaching load when

254 preparing a new course, but it is expected to decrease the longer the COVID-19 situation lasts.

255 A time-independent factor contributing to the negative learning experience could be the loss of human

256 interaction (Marzoli et al., 2021; Eklund et al., 2022; Ljunghammar and Waxell, 2020; Romeo et al.,

257 2021). Traditional classroom teaching comprises student-teacher and student-student interaction

258 (discussing e.g., lecture content, social and private life). Instead, in distance education such important

259 physical, psychological, and social factors are missing or are limited (Berry, 2019; Lehman, 2006;

260 Raffetti and Di Baldassarre, 2022) affecting the students' metacognition (Romeo et al., 2021; Eklund

261 et al., 2022). A lack of social interactions can make students lose self-motivation, social skills, become

262 unaware of limits and obligations leading ultimately to anxiety and depression (Marzoli et al., 2021;

263 Eklund et al., 2022; Ljunghammar and Waxell, 2020; Romeo et al., 2021). This demonstrates that for

264 students it is not sufficient to acquire only theoretical knowledge. But it is necessary to grow as a person,

265 apply the newly gained knowledge, and learn from mistakes in a stimulating and social environment

266 (Ferretti et al., 2019; Glagovich and Swierczynski, 2004; Ryoo and Kekelis, 2018).

Concluding remarks and outlook

Twenty-eight respondents to our survey, working at Universities across Europe in the field of hydrology, answered that pre-COVID-19 conservative classroom lectures, laboratory and fieldwork were commonly used teaching formats in courses with 10 to more than 40 students. Similar results were found in literature. Additionally, our survey indicated that less than half of the respondents indicated using classroom assessment techniques to improve and gauge the students' performance. Students were examined in a closed book or oral exams.

COVID-19 forced hydrological education to move suddenly from classroom to online teaching which perhaps was only possible because of the available digital tools and technical infrastructure. The practiced teaching format remained lectures. Instead, practical teaching methods, which are so important for hydrology, were terminated.

Overall, the majority of the respondents reported that the COVID-19 crisis impacted student learning negatively up to very negatively. The online interaction was more difficult and cost extra time. Teachers lost student contact and it was difficult to assess whether students achieved the learning outcomes. However, most of the respondents reported that they do not use classroom assessment techniques. The most affected learning activities were the ones that could not be moved to online teaching, such as laboratory and fieldwork (Figure 8). As discussed by Wagener et al. (2012), laboratory and fieldwork were already strongly reduced from the teaching curricula in many universities in pre-COVID-19 times, reaching a critical level. Hence, due to COVID-19 the important knowledge of process understanding in hydrology will be missing for at least several cohorts of hydrologists. Transferring passion for water related topics and hydrological knowledge and obtained in a stimulating and social environment got disrupted affecting generations of students. In this way, COVID-19 caused a secondary effect on society, a loss of knowledge and skills, which are needed to tackle the existing and future local and global environmental challenges. This highlights that COVID-19 added a new layer of complexity on top of the already existing challenges in hydrological education pointed out by Wagener et al. (2012).

In the open feedback, respondents expressed their frustration of COVID-19 caused in teaching. However, next to all the COVID-19 misery, a spirit of optimism and a time of change could be noticed.

294 COVID-19 made it possible to explore, improvise and use novel teaching methods. Positive aspects

295 were bottom-up initiatives sharing knowledge and resources on different social media and websites

296 (Table 2). Such efforts highlight that even during extremes such as COVID-19, with creativity,

297 improvising, and sharing technical aspects and material as a community by e.g., Sprenger (2020) it was

298 possible to teach hydrology and overcome limitations during and beyond the pandemic. To learn from

299 this COVID-19 experience and improve the online teaching and learning experience the MOCHA

300 ABCD lesson design, proposed by Wagener et al. (2012), should be adapted for the online environment.

301 Such a to be developed "eMOCHA" lesson design for the online environment should include

302 suggestions from e.g., Ellis et al. (2009) and Berry (2019b) considering the online digital context in the

303 lecture design, workload, interactivity, engage students through personal and professional interaction.

304 Furthermore, it needs to be evaluated and studied which teaching formats worked, which elements are

305 valuable to keep, and whether we, as a community, want to go back to the more traditional teaching

306 styles in post-COVID-19 hydrology and water education or take the opportunity and finally make the

307 next step in teaching hydrology and water education. Especially the range of practical and "exotic"

308 teaching formats practiced during COVID-19 (Figure 4a), home experiments using improvised low-

309 budget or high-cost materials similar to e.g., Hut et al. (2020) and Kinar (2021) or learn how to program

310 e.g., Kelleher et al. (2022) taught at distance or could be an add-on to classical classroom teaching.

311 Such activities promote learning, by not only considering the lower cognitive domains of Bloom's

312 Taxonomy (a.k.a., Bloom's Taxonomy of Learning Objectives, which identifies six cognitive levels

313 from simple to more complex behavior including knowledge, comprehension, application, analysis,

314 synthesis, and evaluation/creation (Gogus, 2012)), but also stimulate the higher cognitive levels by

315 synthesizing, evaluating and discussing water concepts in a safe social environment which facilitate to

316 produce new original work. Even more, it could be a solution to repair the damage (reduced practical

317 training) in hydrology and water education by making practical and "exotic" teaching formats

318 accessible for all hydrology and water students. The aforementioned initiatives showcase that hydrology

319 is not only a scientific community effort but above all it needs "a hydrological community to raise a

320 hydrologist" (Wagener et al., 2012) who can solve old (Blöschl et al., 2019) and pose new hydrological

321 questions.

322 The presented results are a first snapshot overview of how COVID-19 affected water education

323 throughout Europe. The long-term effect on water education is uncertain and needs further analysis

324 focusing not only education, but also the social interactions, gender and regional differences to prepare

325 hydrology education for future disruptive natural or other hazardous events.

Data availability

327 The anonymized response data is available as supplementary data and the MATLAB script (to make

328 figure 2-8) is available on https://github.com/hydrodroplets/COVID-19

546 # Tables

547 ***Table 1 The different sections of the survey.***

Information on respondent
Field of hydrology
Role and courses taught
Class size
Water education in pre-COVID-19 times
Teaching learning activities
Classroom assessment techniques
Type of examination
Water education during COVID-19
Which measures did the University take to guarantee the educational continuity
Was more time needed to prepare, hold and wrap up lectures
Teaching aids to continue teaching
Teaching learning activities
Classroom assessment techniques
Type of examination
Was it necessary to adjust learning outcomes and student assessment
Perception of the situation by students and the teaching staff
Did students reach the learning objectives
Was there a difference between spring and autumn
Which part in knowledge and skills in water education got lost due to COVID-19?

549   *Table 2 Overview of different positive novel teaching methods and resources (see link in bibliography for more content).*

Activity	Category	Author	Potential and message
Distance field &/or lab work	Movie exercise	(Stocker, 2020)	Make fieldwork or excursions accessible for a wider educational public
Distance field &/or lab work	Course design	(Mayer and Hug, 2020)	Distance fieldwork could be offered as add on to traditional teaching
Distance field &/or lab work	Course design	(Hut et al., 2020)	Make fieldwork or excursions accessible for a wider educational public
Teaching material	Collection of material	(Sprenger, 2020)	Community platform with different educational material
Teaching material	Sharing	(Schaefli, 2021)	Sharing most important then quality
Classroom assessment technique	Circus/ dance and movie	(Brandimarte, 2021)	Think out of the box and develop novel ways of learning useful to stimulate creativity, learning and outreach activities
Virtual meetings	Best practice	(Gurung, 2020)	Organize distance meetings
Blog	Blog post	(Nassar, 2021)	Sharing experience through social media

593   *The larger the font, the more respondents indicated to use the measure or aid (multiple answers were possible).*

594 # Appendix

595 *Table A1   Questions from the survey "The effect of COVID-19 on water education"*

#	Question
1	At which University do you teach?
2	Please specify the country of your university where you are teaching at
3	What is the field are you are working in (e.g., hydrology, engineering, ecology, water manager, sociology …)?
4	What is your role in teaching? (Multiple options possible)
5	Which level do you teach? (Multiple options possible)
6	Which courses do you teach (hydrology, ecology ...)?
7	How many students do you have on average in your courses? (One options possible)
8	Which format do you generally teach in your lectures (during non COVID-19 times)? (Multiple options possible)
9	Do you use classroom assessment techniques (kahoot, mentimeter, muddiest point, peer review...) in your course(s)? If so, please specify below which (ones) are:
10	Which type of examination do you generally use to (test) asses the knowledge of students (more options possible)
11	Describe shortly which measures your university took during COVID-19 to guarantee the educational continuity.
12	How much time did you spend to PREPARE the teaching and learning activities compared to the pre-COVID-19 measures?
13	How much time did you spend DURING teaching and learning activities compared to the pre-COVID-19 measures? (e.g., extra time needed to explain concepts or give support to students)
14	How much time did you spend to AFTER the teaching and learning activities compared to the pre-COVID-19 measures? (Examination, wrap up of course, ...)
15	Which technical aids did you use to continue teaching (e.g., computer programs ...)?
16	Which teaching formats did you use to continue teaching? (Multiple options possible)
17	Did you need to make changes in the learning outcomes?
18	If you selected in question Qv17 yes, please specify how:
19	Did the assessment/ examination of the course(s) change due to COVID-19?
20	If you selected in question Q19 yes, please specify how:
21	If the way of teaching changed, was this a positive or negative development from a teacher's point of view?
22	In case of negative development, what could be done to overcome these limitations?
23	Please fill in: Students were able to focus during the lectures:
24	Did you have the feeling that students could reach the learning objectives despite the COVID-19 measures?
25	If the way of teaching changed, how was the student feedback?
26	In case students had negative experiences, what could be done to overcome these limitations?
27	From your teaching experience, how good did students achieve their learning outcomes of the course(s) compared to pre-COVID-19 situation? The students performed
28	Was there a difference between the 2020 spring and autumn semester?
29	Which part in knowledge and skills in water education got lost due to COVID-19?
30	Open feedback (you can write here additional information you want to share concerning teaching during COVID-19)
